

Building the Python Equivalent of the NCL Visualization Gallery

NCAR's Pivot-to-Python

20 *H. Rose Craker*

Purdue University, SIParCS

July 30, 2020

History of NCL

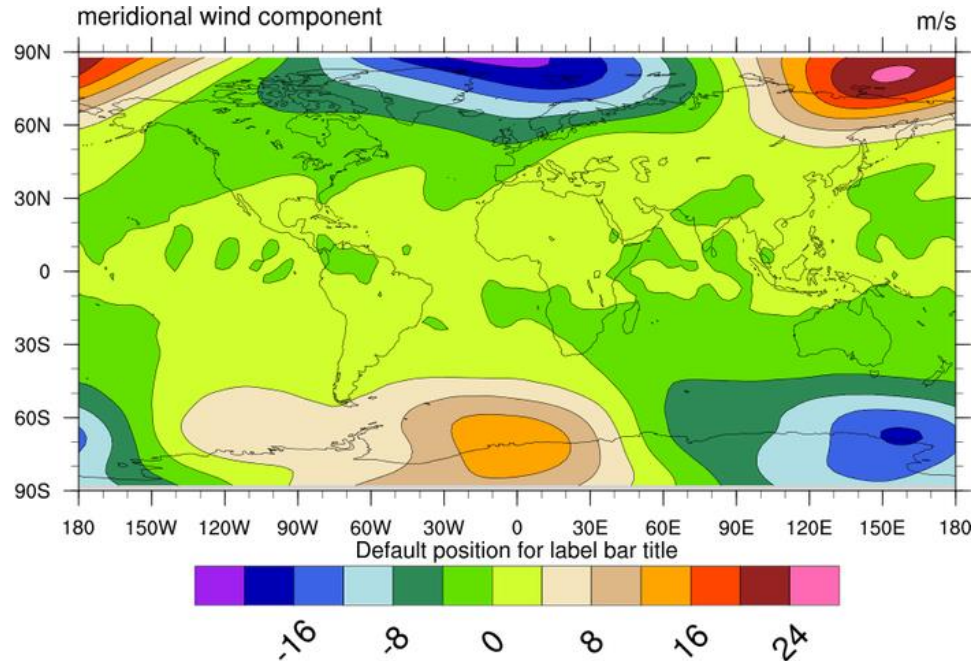

Created specifically for the Earth Sciences 1995 by NCAR

All-in-one tool for visualization of large, multidimensional data sets

Functions built in for niche computational routines

Made creating meteorology specific plots simple

Extensive library for cartography

Motivation for Transitioning to Python

Maintaining NCL and its associated packages became difficult with reduced staff and a smaller budget

Python packages already exist for handling NetCDF data, visualization, cartography, and more

Python is free, open source, and already popular in the scientific community

xarray

NumPy 

matplotlib 
Version 3.2.2

Purpose of the GeoCAT Example Gallery

Making the transition to Python easier

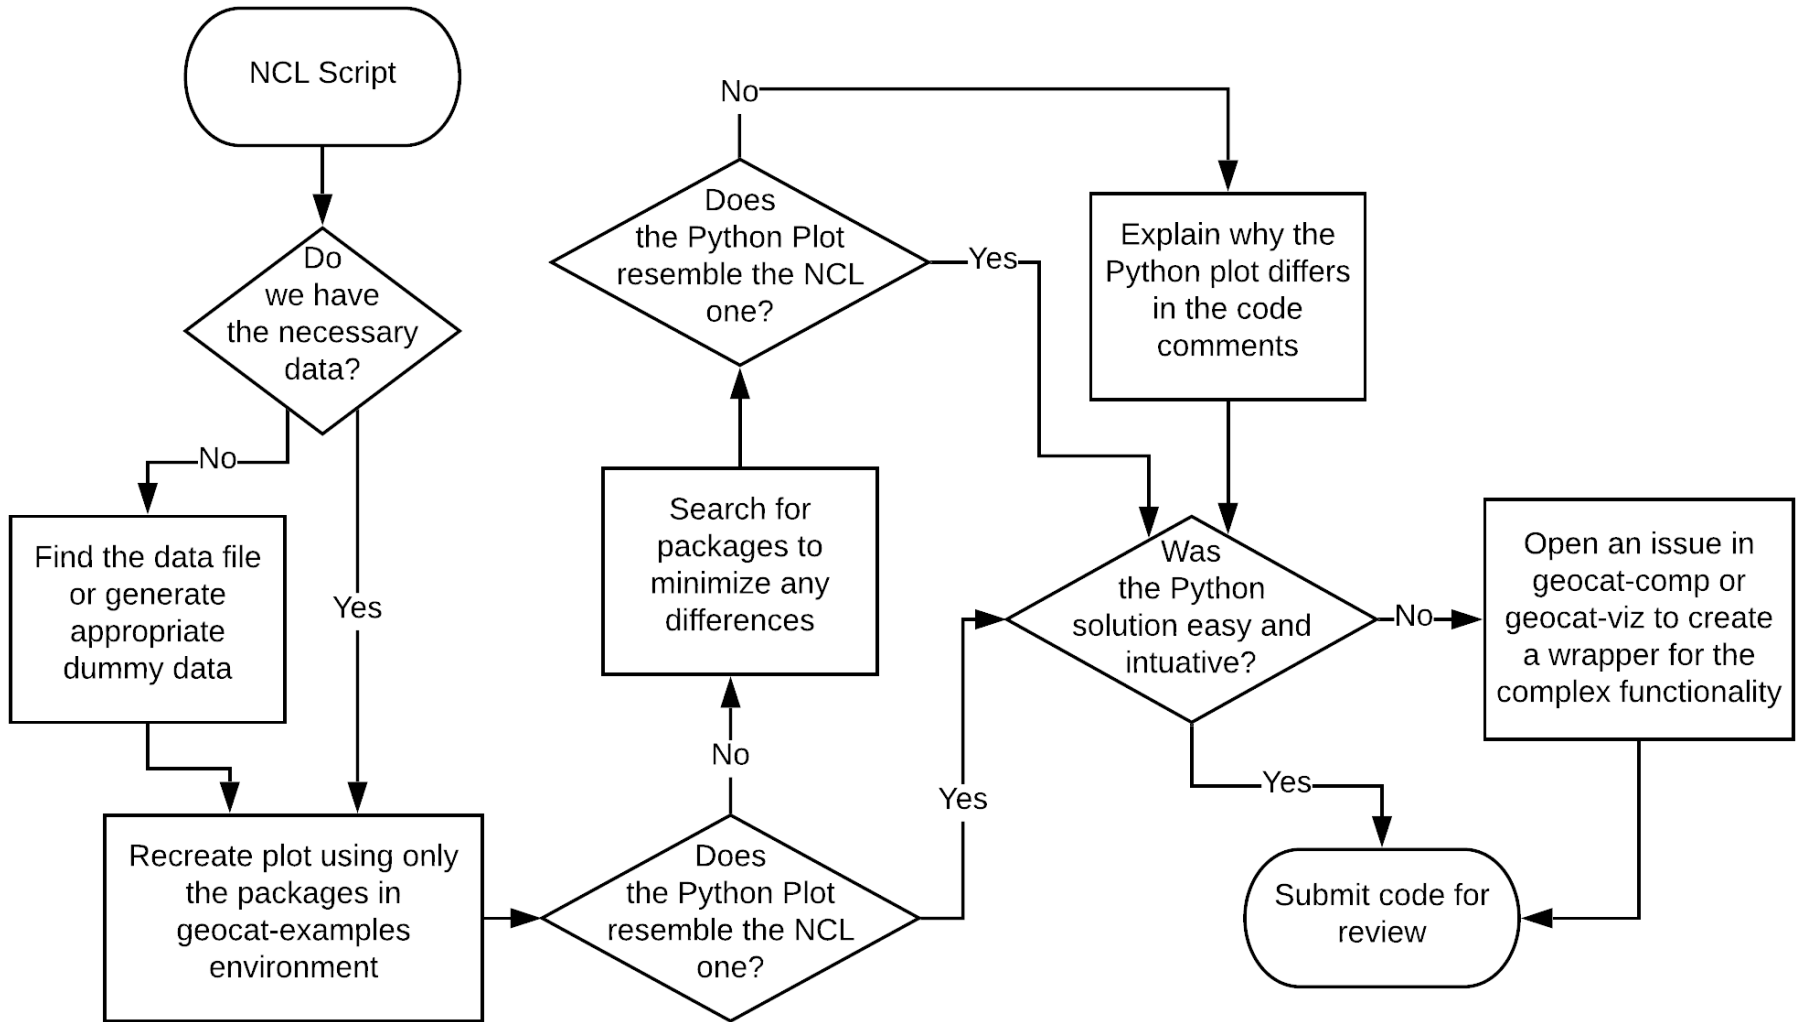

Providing scientists who are using NCL with example code for the same types of plots

Explaining the limitations of Python where needed

Showing the additional features Python provides that don't exist in NCL

Providing resources for how to make accessible visualizations

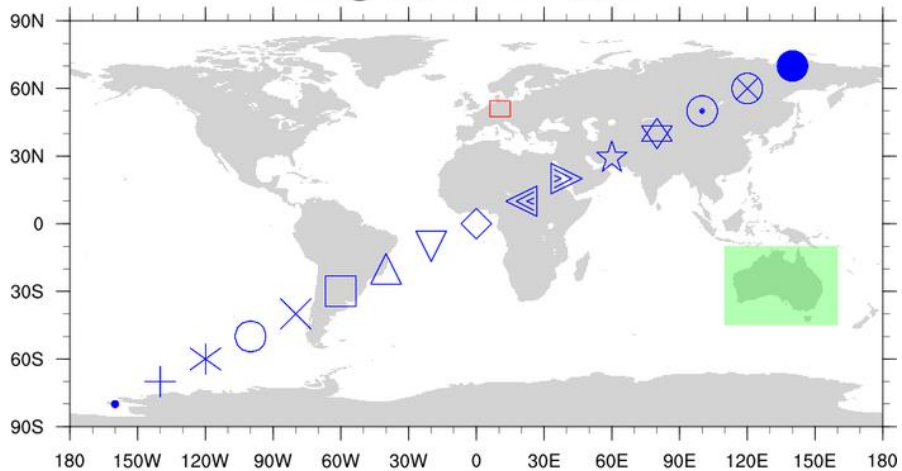

Process

polyg_18.ncl versus NCL_polyg_18.py

NCL Made Example

Big centered title

Marker (left justified text)

Polyline (centered text)

Polygon (right justified text)

Python Made Example

Big centered title

Marker (left justified text)

Polyline (centered text)

Polygon (right justified text)

xy_4.ncl versus NCL_xy_4.py

NCL Made Example

Make your own marker

Python Made Example

Make your own marker

More Complex Examples In Python

meridional wind component

m/s

Making the map boundaries conform to the curves of the projection

NCL: 1 line

Python: 5 lines and a lot of debugging and math for one case

Supporting Packages from GeoCAT

Python has its limitations

Geocat-comp wraps some of NCL's computational routines

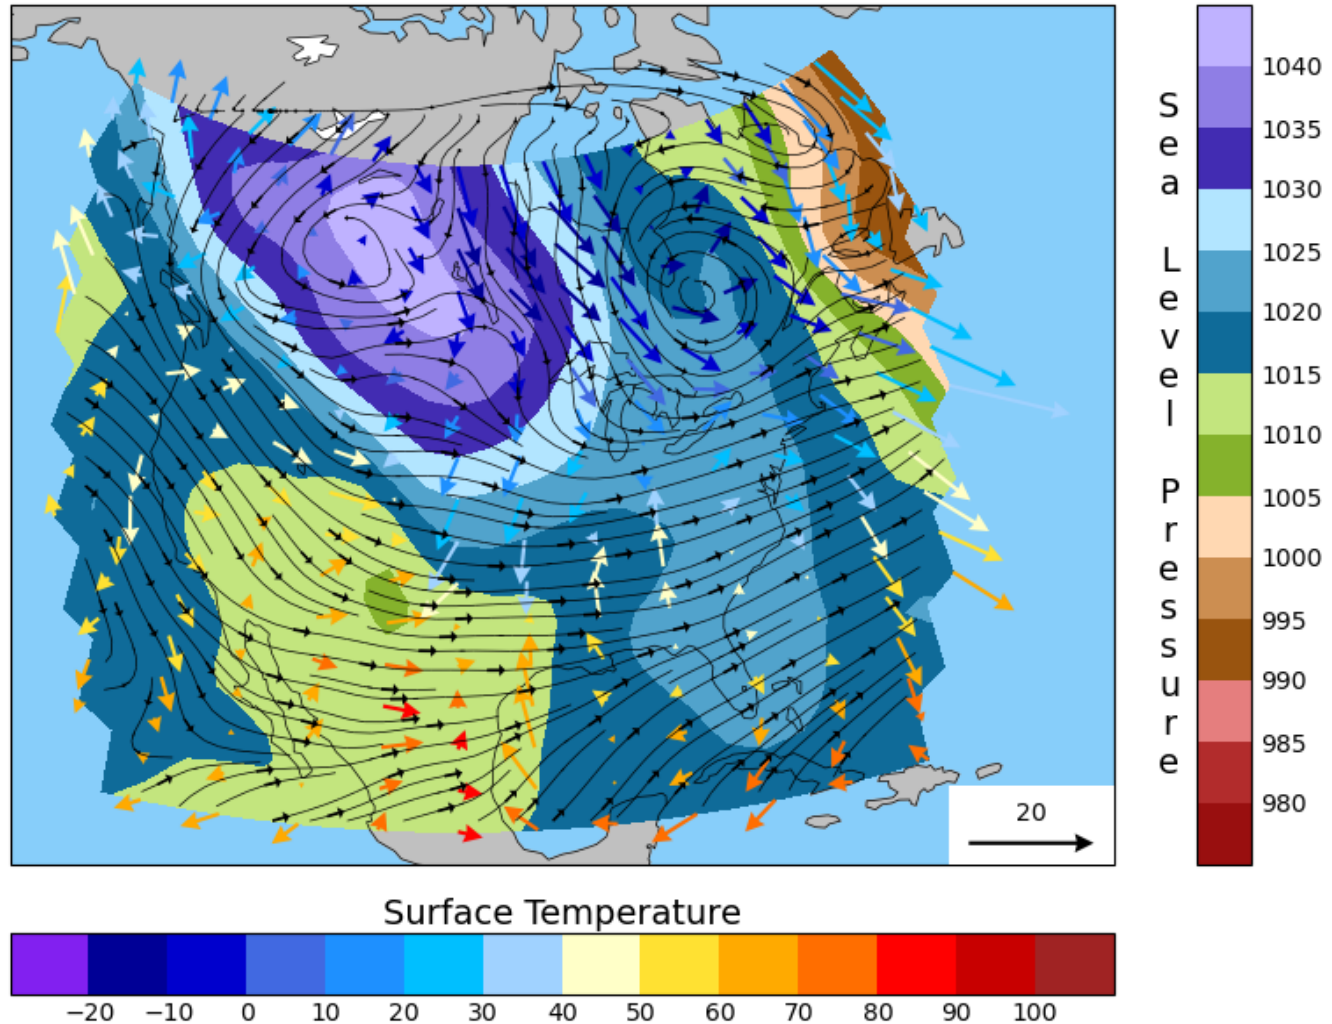

Geocat-viz adds utility functions to make Python generated plots resemble NCL generated plots aesthetically

These packages are also following a continuous release model

Over time more functions will be added

Poor Quality Visualizations

January 1996 Snow Storm
1996 01 05 00:00 + 0

More than Rebuilding

Opportunity to expand on what NCL has provided

A teaching tool for Python and best practices for data visualizations

Comparing and contrasting different color maps

Figure 1:
Rainbow Color Projection

Figure 4:
Magma Color Projection

Future Work for the Gallery and GeoCAT

Create the remainder of the examples in Python

Add examples discussing best practices for data visualization

Add pages to gallery with tutorials for specific plot elements with relevant examples linked

Continue to add NCL's core functionalities and computational routines to **geocat-viz** and **geocat-comp**

GeoCAT Examples Gallery
